UHASSELT

Our Pitch Deck

- **LivePark**
- GameScale
- EnergySense

LivePark

Team Wybe

Problems

Chaotic traffic flow

Unnecessary circling

Increased emissions

All due to a lack of available information to the driver

The solution: LivePark

Consult status

Real-time occupancy dashboard view within 2 seconds.

Confirm Occupancy

Geofencing triggers push notifications for quick crowd-validated updates.

Architecture & Privacy by Design

Modular Interface

Configurable data source switching between mock data and database providers without code changes.

Zero personal Data

Geofencing checks happen client-side. No license plates or tracking histories are ever stored.

Project Effort & Cost

Team Effort: 137 person-days calculated from study points (39 SP total across 5 students).

Work Packages: Analysis, implementation, testing, and deployment/documentation.

Total development cost estimate

€ 68.500

~ €500 / person-day

Cost Comparison: LivePark vs Hardware

LivePark (Pure software)

€68.500 total cost

Zero physical hardware purchases, zero asphalt drilling, and zero ongoing maintenance overhead.

Traditional Hardware

€75.000 + Hardware CAPEX

Requires sensor procurement, gateways, civil installation work, and continuous technical servicing.

Expected Benefits

Less time wasted

Less emissions

Less frustration

To establish LivePark as the leading, scalable, and zero-infrastructure smart mobility standard for Campus Diepenbeek.

Our Pitch Deck

- LivePark
- **GameScale**
- EnergySense

GameScale

A private world should be a link, not a project.

Team Wybe

How to keep a game server online?

01 **Rent a hosted server (VPS)**

- $10 - $30 per month
- Not fit for irregular play
- Costly subscription for students/kids

How to keep a game server online?

01	**Rent a hosted server (VPS)**	• $10 - $30 per month • Not fit for irregular play • Costly subscription for students/kids
02	**Host it yourself**	• Open a port on router (risky) • Impossible on many ISPs • Open IP invites griefers and hackers

How to keep a game server online?

01	**Rent a hosted server (VPS)**	• $10 - $30 per month • Not fit for irregular play • Costly subscription for students/kids
02	**Host it yourself**	• Open a port on router (risky) • Impossible on many ISPs • Open IP invites griefers and hackers

My experience to find a solution:

- Open up a port on router
- Setup and link TCP-Shield
- Setup cloudflare and DNS
- A third party docker container to manage the server

How to keep a game server online?

01	Rent a hosted server (VPS)	• $10 - $30 per month • Not fit for irregular play • Costly subscription for students/kids
02	Host it yourself	• Open a port on router (risky) • Impossible on many ISPs (CGNAT) • Open IP invites griefers and hackers

My experience to find a solution:

- Open up a port on router
- Setup and link TCP-Shield
- Setup cloudflare and DNS
- A third party docker container to manage the server

TOOK ME 2 WEEKS TO GET IT TO WORK!

How to keep a game server online?

01	Rent a hosted server (VPS)	• $10 - $30 per month • Not fit for irregular play • Costly subscription for students/kids
02	Host it yourself	• Open a port on router (risky) • Impossible on many ISPs (CGNAT) • Open IP invites griefers and hackers

This is bad because:

- Groups give up
- They start paying for a VPS
- Lose worlds to crashes, a griefer or save corruption

TOOK ME 2 WEEKS TO GET IT TO WORK!

How to keep a game server online?

01	**Rent a hosted server (VPS)**	• $10 - $30 per month • Not fit for irregular play • Costly subscription for students/kids
02	**Host it yourself**	• Open a port on router (risky) • Impossible on many ISPs (CGNAT) • Open IP invites griefers and hackers

The PC that could host it is already there. Networking is the only barrier.

How to keep a game server online?

01	**Rent a hosted server (VPS)**	• $10 - $30 per month • Not fit for irregular play • Costly subscription for students/kids
02	**Host it yourself**	• Open a port on router (risky) • Impossible on many ISPs (CGNAT) • Open IP invites griefers and hackers
03	**GameScale**	• **Free for small friend groups** • **Local app, no networking setup** • **Peer-to-peer VPN on the host PC**

What GameScale does

Free for small groups · Local app · Peer-to-peer VPN on the host

Private server

Runs on a PC you already own

Lobby link

Share with friends in one click

Peer-to-peer

Overlay connects the group

No router changes

No public IPv4 needed

No open ports

Host stays closed

Private traffic

Stays between the players

A game night becomes

Start a world

Pick a game. GameScale starts the server and creates a lobby link.

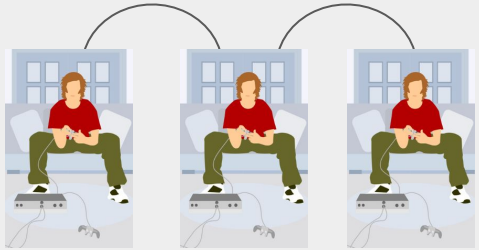

Share the link

Friends open it from chat and join the network.

Manage the world

Roll back after griefing or a bad save. Mods sync to every player.
Manage the server through a user friendly dashboard.

Why we want to build it

We know this problem

We have had this problem personally. The PC is already on someone's desk. Networking should not be the price of playing together.

The cost is wrong

Five friends on a €15 server spend about €180 a year to play irregularly. Setup should take minutes, and a world that took weeks should survive a crash.

GameScale

A private world should be a link, not a project.

Team Wybe

Our Pitch Deck

- LivePark
- GameScale
- **EnergySense**

EnergySense

Team Wybe

Situation

Bakery turns on **oven, mixer and heat pump** all at once.

15 minute peak sets **high grid-fee for whole month.**

No one notices until the bill arrives.

Solution

One **dashboard** that turns an SME's **electricity, gas and water** meters into **lower bills**.

Bonus: ready-made sustainability report.

EnergySense

Team Wybe

Problems

Invisible Peaks

Hidden Waste

Reporting Pressure

Problems

Invisible Peaks

Hidden Waste

Reporting Pressure

The necessary data already exists! Tool is missing.

The Idea

Supplier portal(s)

Separate portal for each utility

Only **raw data**

No automatic actions

EnergySense

One **unified** dashboard

Easy to understand data

Alerts

Automatic actions

EnergySense in action: Peak prediction

System

Predicts a peak.

→

System

Sends push notification to manager.

"Delay the heat pump by 15 minutes"

→

Manager

Applies the suggested delay.

EnergySense in action: Report generation

System

Collects energy usage data.

Manager

Requests an ISO 50001 compliant report.

System

Gives a full PDF and CSV report.

Cost and Benefit

Example SME: **€50.000** on energy and water per year.
Assume **only 10% saved** per year by preventing peaks and waste.

€5.000

saved per year

– €1.200

yearly cost for EnergySense

= €3.800

net savings per year

Cost and Benefit

No need to hire an **energy manager** for reporting.

Less **environmental impact.**

Summary

Lower Bills

Less Emissions

Easy Sustainability Report

Summary

Lower Bills

Less Emissions

Easy Sustainability Report

The meters are already on the wall. EnergySense makes them work for you.
